

Execution Mode

The execution mode defines how URLs are accessed.

Mode	Description
parallel / p	URLs are called without waiting for each other.
sequential / s	Each URL is accessed one at a time.

Parallel mode, is the normal mode for a modern browser. The URL elements of each subsequent page will load at the same time. There is no waiting for a particular URL to be completed before moving on to the next.

In sequential mode only one URL will load at a time. Each call will wait for the previous URL before moving on.
